GREEN BUILDING CONSTRUCTION STATEMENT

Planning Department
City of Coconut Creek

Re: Addition to Administrative Offices for
SOS Children's Villages
3681 NW 59 Place, Coconut Creek, Florida
Job No. 19-08-77

In accordance with Section 13-320 of the City of Coconut Creek's code, which recognizes that green building construction improves the efficiency with which sites utilize energy, water, and building materials to reduce development impacts on the environment and the city, all new development or redevelopment applications shall address the green building components detailed in Section 13-320(b) at time of development application submittal.

More precise details for the building will be included in the site plan submittal. The following are the guiding components that will be included:

I. Conservation of Natural Resources

A. Sustainable Site Development
   1. Construction Pollution Prevention - An erosion and sedimentation control plan will be developed and implemented to control erosion and air born dust.
   2. Construction Site Materials Recycling - Utilizing construction waste management practices 75% of the project's construction waste will recovered, reused and recycled. A regional waste management hauler shall be hired to haul, separate, sort and document all construction waste.

B. Minimize Disruption of Existing Plants and Trees
   1. Native soil will be protected in areas not affected by the new construction.
   2. Existing plants will be protected during construction and relocated, if necessary, for the placement of the new addition.

C. Water Management
   Storm water drainage system will incorporate a combination of swale and underground storage enhancing drainage sustainability.

D. Protect Water Quality
   1. Landscape design will incorporate native plant species and Xeriscaping to reduce need for landscape irrigation.
   2. Water Efficiency - Toilets, urinals, private lavatory faucets and shower heads shall be water sense labeled and/or meet/exceed the USGBC baseline consumption values (water closet 1.6 GPF, lavatory faucets (restroom) 0.5 GPM, kitchen faucet 2.2 GPM, shower head 2.5 GPM)

E. Building Materials
   1. The use of pre-engineered wood trusses makes use of small dimension lumber and helps preserve old growth forests.
   2. The use of metal studs for interior wall partitions instead of wood studs helps in the preservation of existing forests.
   3. The use of cement tile roof will provide a 50%-75% longer lifespan than asphalt-based roofing systems.

F. Recycling of Demolished Waste
   1. Recycling of Demolished Waste - The building will incorporate a high level of regional and recycled material. By utilizing construction waste management practices, the project will divert 75-80% of construction waste based on weight. A regional waste management hauler will be hired to haul, separate, sort and document all construction waste.
   2. Building Re-Use - The existing buildings will remain. Only minor modifications are being implemented in order to connect to the new addition.

II. Energy Efficiency

A. Energy Performance - Building will be designed to meet the 2017 Florida Building Code and Florida energy code which is 20% above the national baseline.
B. Building
   1. Use of high energy efficiency windows will reduce heat gain and the consumption of electricity.
   2. Properly sealing and caulking all openings and joints will reduce heat gain and consumption of electricity.
C. Electrical and Air Conditioning
   1. Use of efficient appliances and LED lights will reduce the consumption of electricity.
   2. Installation of a tankless water heater will reduce consumption of electricity.
   3. Use of high SEER/EER air conditioning system and non-HCF refrigerant will reduce consumption of electricity.
   4. Use of duct mastic on all air conditioning duct joints will reduce conditioned air loss and consumption of electricity.

III. Indoor Air Quality

A. Materials
   1. Use of low or no VOC paint and wood finishes will improve air quality.
   2. Use of formaldehyde-free materials will improve air quality.
B. Air Filtration
   We will install high efficiency particulate air (HEPA) filter.

10. Erosion control devices such as silt fencing, debris basins, and water diversion structures shall be installed to prevent siltation and/or erosion within the tree protection zone.
11. Roots shall be cut manually by digging a trench and cutting exposed roots with a saw, vibrating knife, rock saw, narrow trencher with sharp blades, or other approved root pruning equipment.

G. TREE RELOCATION (These notes for relocation trees only and if applicable)

1. Flag all trees and palms to be transplanted with differentiating color than those to be saved or removed.
2. Tree Relocation process must be performed or supervised by ISA Certified Arborist.
3. Water the root zones to field capacity for 5 continuous days before root pruning. At a minimum soak the soil to a 4'-0" depth within a 6' radius.
   Root prune a minimum of six weeks before relocation. Prune away all dead or damaged limbs or fronds. For trees, prune out 1/3 of the existing canopy by selectively trimming small internal branches. For palms, gather fronds above the bud and tie them loosely with jute twine to avoid damage.
4. Brace root pruned trees awaiting relocation.
5. Root prune ½rd of the root system, irrigate daily for 2 weeks then root prune another ½ rd, irrigate daily and prune last ½ rd on actual relocation date, no less than two weeks (six weeks total minimum root pruning by stages). ISA Arborist on staff shall observe for intense shock. Canopy pruning may be deemed necessary by Arborist on staff to balance for intense root ball loss, canopy shall be trimmed only as necessary to increase survival.
6. Root prune with proper clean equipment to sever roots. Ensure roots are not torn or pulled apart.
7. With hand tools, dig a 2'-0" wide by 3'-0" deep trench at a minimum distance as determined by the consulting arborist to expose roots. Cut all roots 1.5" and larger in diameter with a clean, sharp pruning saw. Treat all cuts with a fungicidal barrier. Backfill the trench, within 4 hours of digging, with a 1:1 mixture of site soil and sawdust or other fine organic material. Do not compact.
8. Form a rootball size in compliance with Florida grades and Florida standards number 1 or better.
9. Maintain the soil moisture at field capacity throughout the six weeks.
10. Allow the plant to regenerate roots over a period of six weeks.
11. At the end of six weeks, prepare the planting pit at the new location. Overdig the hole diameter a minimum of 2' beyond the root ball, with the recipient hole to be at least 1/3 larger than the area that was trenched for transplanting.
12. With the consulting arborist present, undercut the entire root ball of the plants to be transplanted at a depth specified by the arborist. The undercutting method may be a choker cable drawn through the root ball with heavy equipment.
13. At the direction of a professional rigger, assemble slings, padding, guiding ropes and cables for attachment to the crane or backhoe. The professional rigger shall determine the size of machinery necessary to execute the lifting and moving operation.
14. Install trees within 24 hours of removal from their original location to locations provided by Landscape Architect or Developer with approval of municipal / Landscape Inspector.
15. Experienced Tree Spade operator shall move tree or experienced tree mover shall choose best means and methods to strap and rig tree for transporting safely without damage to new location.
16. Maintain trees in a healthy and vigorous condition during installation and throughout the plant establishment period. Replace trees that do not meet this requirement with the same species, size, and quality or per mitigation requirements specific to the governing authority with jurisdiction.
17. Fertilize the plant as directed by the consulting arborist.
18. When the plant is placed in the new location, backfill the planting pit with topsoil and water thoroughly to eliminate air pockets and compact the soil. Set the tree no deeper than its original condition.
19. Cover the root ball area with 3" depth of organic mulch.
20. Provide fungicide and fertility applications at the direction of the consulting arborist.
21. Post transplant watering to provide moisture and reduce any excessive stress due to root desiccation. Watering to be adjusted according to conditions and at the supervision and direction of the ISA certified arborist.
22. The diameter of the root–pruning or transplanting circle shall be at a distance away from the trunk equal to 12 times each inch of trunk diameter at breast height.
23. For all palms except Sabal palmetto, the lower fronds shall be pruned leaving 9-11 fronds that can be tied without an extensive amount of weight that may damage the heart of the palm. The Sabal palmetto shall have all fronds cut without damaging the bud.
24. Transplanting must occur within 24 hours after being dug for relocation. Trees/palms should be kept in shade and the canopy kept moist.
25. Digging and preparation of the new hole for the transplant shall be done prior to removing the tree from the existing location.
26. The landscape Contractor is to verify that all new holes have appropriate percolation.
